

## The German Venture Capital Market from a US Perspective

### I. Introduction

Emerging growth companies in the United States have been benefiting from the sophisticated venture capital market of the United States for decades. Well-known companies such as Apple, Compaq, Sun Microsystems and Intel would have probably not reached their standing without seed-investments by venture capitalists. The situation is very different in most of Europe and Germany where emerging companies have been disadvantaged by a lack of a developed venture capital industry.

While large buyout transactions show impressive growth rates in Germany, the venture investing environment remains depressed and accounts for only 9.4 percent of all new funds raised in 2004, even less than those in 2003.<sup>1</sup> However, the volume of all venture capital investments, seed, start-up, and expansion financings increased by almost 50 percent in 2004 from €707.9 million to €1,079.4 million.<sup>2</sup>

The trend has been similar in the United States where according to the National Venture Capital Association, total venture capital investments decreased from \$106.4 billion in 2000 to just \$18.3 billion in 2003,<sup>3</sup> while bouncing back to \$21 billion in 2004.<sup>4</sup>

While the burst of the tech bubble led to a downturn in this asset class, on both sides of the Atlantic, the major difference is that the starting point was different. While Germany's venture capital industry was even at its height not much more than a cottage industry, venture capital in the United States is a mature asset class whose economic significance is out of question. In 2004 the size of venture capital investments in 2004 was still almost 18 times

larger than Germany's. In 2004, venture capitalists invested in emerging growth companies in the Washington metro area almost as much as in all German portfolio companies combined.<sup>5</sup>

## II. Structural Challenges

Observers have pointed to several reasons for Germany's relatively weak VC market: the overall IPO situation on the German capital market and the lack of viable liquidity events. One fact is that many start-up companies hesitate to spend the money and time to elaborate a convincing business plan that might attract venture capital investors. Some entrepreneurs are also worried that the venture capitalist might have too much control in the management of the company. Others are not familiar with the very nature of the venture capital industry. A number of prospective portfolio companies seek venture capital without giving investors any right to advice or assist in management decisions.

Some observers point to the fact, that other than in the United States which has a strong entrepreneurial mentality, there is a deep risk averseness based in society as a whole. As a result potential investors shy away from early-stage investments because they dread the risk to lose the investment. Moreover, many domestic investors got burned when the tech bubble burst and ever since avoid early stage investments while focusing on mature companies. Another problem is the unfavorable taxation of domestic venture capital funds. As a result, several German venture capitalists have opted in the past to locate their new funds abroad, preferably in tax havens such as the Channel Islands like Guernsey and Jersey.<sup>6</sup> It has to be seen whether the new German government will promulgate more favorable rules in this regard. The coalition agreement seems to indicate that positive changes lie ahead.

The main structural flaw of the industry is the absence of major local venture capital firms and the modest volume of total capital under management. While TVM has €18

million under management, with two funds in the United States and six Germany based funds, most other domestic venture capitalists have less than €400 million under management. Whereas no German venture capitalist was able to close a new fund within two years, American venture capitalists closed 108 funds in 2005 and 116 in 2004.<sup>7</sup> At this time there are no major German venture capital companies comparable to American Sequoia Capital or Kleiner Perkins making it more difficult for start-ups to obtain early stage venture capital. While the largest German VC fund was closed with €336 million, New Enterprise Associates recently announced to close a new fund with \$2.5 billion.

The main problem is the little interest of institutional investors in venture capital. While fundraising in Germany is hard enough for buyout funds, domestic institutional investors have shown even less interest in committing venture capital. Recent funds could only be closed with the backing of the European Investment Fund (EIF).<sup>8</sup>

As a result of the difficult fundraising challenge, the total number of venture capital firms is relatively low. While there are 1,251 venture capital firms in the United States managing 3,370 funds,<sup>9</sup> there are only around twenty active venture capitalist firms among the 174 private equity firms in Germany.

### **III. Signs of Improvement**

Nonetheless there are signs of recovery of the German venture capital market. Pursuant to a study by FHP Private Equity Consultants sales of venture capital backed companies have reached the highest level for three years in the second half of 2005. Above all, venture capitalists benefit from a recovering capital market environment; eight out of fourteen IPO's in 2005 were successful venture capital exits. Even German venture capital companies acknowledge significant improvements in the venture capital environment and are

more optimistic for 2006. Although German venture capital firms were unable to close a new fund for two years, new funds were finally closed in 2005.

What must be noted is that the German venture capital industry's malaise is not due to a lack of innovation. German businesses are among the most innovative companies in the world and have filed 14,870 patents in 2004 which is equal to 12.4 percent of all patents filed world wide.<sup>10</sup> In fact, German companies rank third in the total number of patent filings behind US companies with 41,870 patent filings (36.8 percent market share) and Japanese companies which filed 19,982 patents (16.6 percent market share).<sup>11</sup> The technological edge of German companies is obvious in the European context. In 2004, French companies filed only 5,281 patents and British businesses account for 5,056 patent filings. Global venture capitalists should keep these numbers in mind since innovative products and assets in form of marketable patents are prerequisites for a successful exit.

#### **IV. Opportunities for American Venture Capitalists: Lessons from Skype**

Although unknown to many, the German venture capital market is an attractive market for American venture capitalists at a time when many VC's plan to increase their global investments. According to the Deloitte & NVCA 2005 Global Venture Capital Survey, 20 percent of U.S. based VC respondents intend to increase their global investment activity over the next five years, which is up from 11 percent currently investing abroad.<sup>12</sup>

The best example of opportunity in Europe was the successful early stage investment in Luxembourg-based Skype Technologies SA by several smart US-venture capitalists.<sup>13</sup> After less than three years of their initial investment of \$20 million, eBay acquired Skype

Technologies SA for \$2.6 billion in cash and stock plus about \$1.5 billion in contingent payments,<sup>14</sup> which is by all means a profitable exit.

Another motivation for Silicon Valley based venture capitalists to invest in Germany might result from their own recent fundraising successes. Unlike in Germany, where VC fundraising remains a challenge and funds are small, American venture capitalists are sitting on a significant amount of funds that need to be invested. Problem for many VCs is that it is increasingly difficult to locate promising start-ups that have not been yet funded by counterparts. Since too much money is chasing too few deals, some start ups face the odd problem that they are offered more VC cash than they need.<sup>15</sup> This contrasts starkly with the situation in Europe, where it is very hard for start-ups to obtain venture capital financing at all. Outbound transatlantic venture capital investments would offer Valley based venture capitalists the opportunity to invest their funds smartly, by benefiting from European innovations and a cash-starved market environment. Due to their extensive experience and financial firepower they would be welcomed by German start-ups and would not face fierce competition from local venture firms that are often themselves in an early stage.

Due to relatively weak competition from domestic venture capital firms, innovative and moderately valued emerging companies, as well as a recent recovery of the capital market, Germany offers numerous opportunities for experienced venture capitalists in the years to come.
